

Milestone 5 – FINAL REFLECTION

For the smart save group project I was in charge of laying the foundation down for the backend that way our logic and structuring was correct and sound for when we would complete the frontend. In the first and second milestone I was in charge of creating the proposal and artifacts of what we'd be using for our backend project and what the main purpose of our project would be as well. From there I created a detailed readme specifying what specifically we all should be working on, come the next sprint. I ended up dealing with the applications and financial savings of the project as well.

In the beginning, our teamwork was a bit uncoordinated and we weren't really communicating as a team in order to finish in a collective manner. Once the second sprint rolled around we were able to break down our responsibilities evenly amongst each other and from there we have been smooth sailing all the way up until our final milestone. Our technical growth grew exponentially when it came to working with API backends and Spring Boot as our java project. In my personal experience I've grown a lot when it comes with working with Java React and how it combines JavaScript with html and CSS in order to bring the frontend to life. It was a bit of a challenge to get our backend working at first, seeing how postman wasn't able to post or gather results from the backend so we decided to go back to the drawing board and gain more experience with working with Maven.

Our ethical standpoint is that AI should be used as a tool instead of a crutch when it comes with dealing AI usage. We made sure to validate our information first hand before we would ask AI to brainstorm or draw up structure ideas for our project idea. Lastly we decided for the last

milestone we would use the AI in order to make sure our project was structurally sound before this final deliverable.
